## AI could soon tell you, how often to see the eye doctor

**Three of the most common chronic eye conditions require regular medical check-ups and injections into the eye by ophthalmology specialists to keep looming blindness at bay. A study by the University of Bern and the Inselspital in collaboration with an AI in eyecare startup now demonstrates that patients' individual ideal frequency for these visits can quite accurately be predicted by machine learning – yielding a threefold benefit.**

Age-related macular degeneration (AMD) is the most common cause of vision loss in people over 50. Up to 12 percent of those over 80 have the chronic disease. An estimated 16.4 million adults are affected by retinal vein occlusion (RVO) worldwide, a condition caused by a thrombosis of a retinal vein. It is the second most common cause of blindness from retinal vascular disease after diabetic retinopathy (DR). DR in turn is the leading cause of blindness in developed countries and affects up to 80 percent of people with more than 20 years of diabetes. It can lead to a swelling of the macula (diabetic macular edema, DME), which may cause partial or complete vision loss.

All three conditions are treated by injections of a so-called anti-vascular endothelial growth factor (anti-VEGF) into the eye at intervals to slow down disease progress and prevent blindness. Because with eyesight a central human sense is in jeopardy, patients are eager to know that they are being treated often enough to avoid rapid worsening. And doctors want to make sure they see each patient frequently enough not to miss important developments.

### **The challenge**

With the ageing population, cases of AMD, RVO or DME are globally on the rise, making it hard for specialized eye clinics to keep up with the growing demand for regular treatments. “As doctors, we want to give each patient the necessary attention and treatment frequency that they need”, says Sebastian Wolf, Head of the Ophthalmology Department of the Inselspital that currently sees 6000 patients with AMD, RVO and DR. “But it is also an organizational challenge to meet all patients' needs and be able to study all relevant eye imaging data to assess individual disease progression and take treatment decisions in the short time given.”

To monitor progression of the chronic eye conditions, Optical Coherence Tomography (OCT), an imaging tool that generates 3D images of the eye at extremely high resolution, is usually applied. In

collaboration with the ARTORG Center for Biomedical Engineering Research, the Inselspital has developed automated OCT analysis tools based on artificial intelligence, which can assist eye doctors in the assessment of a whole patient OCT-set in just a few seconds. Together with RetinAI, a startup specialized in AI-based eye care technologies, they now have conducted a retrospective study of patients to assess how well AI can predict anti-VEGF treatment demand from the start.

### **The setup**

The study looked at OCT-data from 340 patients with AMD and 285 patients with RVO or DME, treated with anti-VEGF at the Inselspital between 2014 and 2018. Based on morphological features automatically extracted from the OCT volumes at baseline and after two consecutive visits, as well as patient demographic information, two machine learning models were trained to predict the probability of the long-term treatment frequency demand of a new patient (one for AMD and one for RVO and DME).

Based on the first three visits, it was possible to predict if a patient had a low or a high treatment demand for both the AMD and the RVO & DME groups with similar high accuracy. More importantly, the study revealed that it is possible to predict reasonably well at the initial visit and even before the first injection if a patient will less often require injections.

### **Three advantages**

“We have shown that machine learning classifiers can predict treatment demand when a patient is first diagnosed with a chronic eye disease,” says Mathias Gallardo, postdoctoral researcher the ARTORG AI in Medical Imaging (AIMI) lab and member of the new Center for Artificial Intelligence in Medicine (CAIM). “Hence, artificial intelligence may assist in establishing patient-specific treatment plans for the most common chronic eye conditions in the near future.”

Planning the ideal treatment frequency for each patient has multiple benefits. Firstly, patients can be sure their disease is being treated in the best way possible without subjecting them to too frequent visits and unpleasant injections into the eye. Secondly, individualized planning can help clinics cope with ever growing patient numbers allowing for the highest possible capacity utilization of specialized medical skills and infrastructure. Thirdly, objectivized on-demand planning helps avoid overprovision and can lead to improved cost-efficiency and less healthcare expenditures.

### **High-yield confluence of clinical, data science, and industrial research**

This study illustrates once more the proven eye-level collaboration between clinicians and data scientists of the Inselspital and the ARTORG Center, which produces technology solutions suitable for everyday use because they were designed directly as a response to clinical needs. A further important aspect to provide a roadmap for the clinical implementation of such technology was the startup RetinAI. “We are extremely happy to apply the EU funding we received to build patient-focused solutions in ophthalmology, making sure that technology can be transformed into products that can really benefit patients and improve treatment at scale,” says RetinAI CEO Carlos Ciller. With its headquarters at sitem-insel the startup also is spatially located exactly at the interface between clinic and science. This unique Bernese environment for clinically driven AI technologies will be further capitalized by the new Center for Artificial Intelligence in Medicine (CAIM), combining the best of the three worlds of healthcare, science, and industry for the benefit of patients.

**Scientific experts:**

- **Prof. Dr.-Ing. Dr. med. Sebastian Wolf**  
Chairman and Head University Department for Ophthalmology, Inselspital, University Hospital Bern
- **Prof. Dr. Dr. med. Martin Zinkernagel**  
Co-Chairman and Head University Department for Ophthalmology, Inselspital, University Hospital Bern
- **Prof. Dr. med. Marion Munk**  
Senior attending in Ophthalmology, Managing Director Bern Photographic Reading Center, University Department for Ophthalmology, Inselspital, University Hospital Bern
- **Prof. Dr. Raphael Sznitman**  
Director ARTORG Center for Biomedical Engineering Research and Center of Artificial Intelligence in Medicine (CAIM), University of Bern
- **Dr. Mathias Gallardo**  
Post doc student, Artificial Intelligence in Medical Imaging Labor, ARTORG Center for Biomedical Engineering Research, Member Center for Artificial Intelligence in Medicine, Universität Bern

### **Center for Artificial Intelligence in Medicine (CAIM)**

The Center for Artificial Intelligence in Medicine is a research, teaching and translation platform for medical technology that uses AI to deliver better care to patients and facilitate the work of doctors and nurses. CAIM capitalizes on the unique constellation in Bern that joins players from the scientific, healthcare and industry domains. It was inaugurated in January 2021 as a Center of the University of Bern's medical faculty and the Inselspital, Bern University Hospital, with the University Psychiatry Services (UPD) and the Swiss Institute for Translational and Entrepreneurial Medicine, sitem-insel, as partners. Part of Bern's initiative for digitalization in healthcare, CAIM is a virtual center connecting engineers, physicians and scientists in the area of AI in medicine and providing them with resources and access to infrastructure. By bundling transdisciplinary know-how from the Bern Biomedical Engineering Network, it promotes and expands projects dedicated to the potential of AI technology for healthcare. CAIM will foster commercialization of AI technology innovation, support start-up incubation and create sustained value through best in class research, translation and economic growth.

**Insel Gruppe** is Switzerland's leading group of hospitals for university and integrated medicine. It offers comprehensive health care based on groundbreaking quality, research, innovation and education: in all stages of life, around the clock and in the right place. The six hospitals comprising Insel Gruppe (Inselspital, Aarberg, Belp, Münsingen, Riggisberg and Tiefenau) carry out over 800,000 outpatient consultations and treat about 60,000 in-patients using the latest therapy methods. It provides training for a large number of professions and is an important institution for the further training of young physicians. Insel Gruppe employs a staff of over 1, 000 (including students).
